

	UNIFIED JUDGING SCORECARD			
	AI · Trading & Strategy Track	Part A - Mantle Network in General	Part B - [Sponsorship] BGA in Specific	
	100 pts	50 pts	50 pts	
	Part A · Mantle general criteria		50 pts	
	Applies to all tracks — scored by all judges			
	Dimension	Points	Key metrics	Description
	Technical	15	Architecture design, security, code quality, feature completeness	Evaluates code robustness and technical complexity. Core functionality must run end-to-end on the Mantle network.
	Ecosystem fit	10	Mantle stack integration, asset integration (DeFi / CeFi), ecosystem complementarity	Measures how effectively the project leverages Mantle's core features and its strategic contribution to the ecosystem.
	Business potential	10	PMF, tokenomics, viability, GTM strategy	Evaluates sustainable revenue potential, genuine user demand, and a credible post-hackathon go-to-market plan.
	Innovation	10	Originality, differentiated advantage, technical or model breakthrough	Encourages novel ideas and approaches that address real industry pain points — not simple forks or clones.
	User experience	5	UI/UX design, onboarding friction, AA / gasless integration	Focuses on product usability and efforts to lower the barrier for Web2 users entering Web3.
	Part A total	50		
	Part B · BGA track-specific criteria			50 pts
	AI Trading & Strategy Track — scored by BGA judges			
	Dimension	Points	Description & key evaluation criteria	
	Alignment with BGA ethos	10	Does the project reflect blockchain-for-good principles? Judges look for financial inclusion, market fairness, and transparency; reduction of information asymmetry between retail and institutional traders; and contribution to healthier ecosystems over purely extractive behavior. We are not rewarding the highest PnL — we are rewarding better systems.	
	Innovation & technical depth	10	Originality of AI + trading stack integration; novel AI applications (quant bots, predictive models, RL, macro-driven agents); quality of Python and/or Solidity implementation beyond a simple API wrapper; meaningful use of Bybit API or on-chain logic; architecture robustness and scalability.	
	Strategy design & risk management	7.5	Is the strategy logic sound, explainable, and defensible? Does the system mitigate risks (overfitting, manipulation, volatility, liquidation)? Are there safeguards against misuse or runaway execution? Consideration for ethical AI deployment in financial contexts.	
	Transparency & verifiability	7.5	Are strategies, signals, or outcomes auditable — on-chain or otherwise? Can users verify performance or inspect trading logic? Does the system reduce "black box" opacity in automated trading?	
	Real-world impact	5	Does it solve a real problem — access, trust, cost, or inefficiency? Bonus consideration for applicability to RWAs, ESG assets, or underserved markets.	
	User accessibility & UX	5	Is the product usable by non-institutional or retail users? Does it simplify complex strategy execution or portfolio management? Clear, intuitive interface and flows.	

	Execution & demo quality	5	Working prototype or MVP completeness; live demo or meaningful simulation using Bybit API or smart contracts; clarity of presentation and coherence between vision and implementation.	
	Part B total	50		
	Grade	Total score	Part A — Mantle general indicators	Part B — BGA track-specific indicators
	Excellent	90 – 100	Breakthrough technical depth; seamless Mantle integration; production-ready with clear business logic loop.	Strongly embodies BGA principles; fully auditable strategy with robust risk controls; compelling real-world impact.
	Good	70 – 89	Stable demo with evident innovation; clear Mantle ecosystem value; solid technical implementation.	Clear BGA alignment; explainable and well-defended strategy; working demo with good user accessibility.
	Average	50 – 69	Core functions implemented; testnet-functional; incremental improvement on an established model.	Surface-level BGA alignment; functional demo with some AI integration; limited transparency or risk management.
	Below avg	30 – 49	Incomplete features or major bugs; lacks Mantle integration; unclear business logic.	Weak BGA alignment; predominantly an API wrapper; strategy opaque or poorly defended; demo gaps.
	Poor	0 – 29	Concept or slides only; direct plagiarism or fork; non-functional or unable to demonstrate.	No meaningful BGA alignment; no original contribution; system non-functional or non-demonstrable.
